The Master's degree course consists of 3 phases that build on one another:

- **Phase 1** facilitates the transfer of the basic skills obtained during the Bachelor's degree to clinical practice. The focus is on disease types, symptoms as an introduction to a pathology and patient needs in the different stages of life;
- **In Phase 2**, the students pass through the sections of the associated clinics in several rotations, acting as part of the team there. In regular one-day stints in a general practice, the students also learn about the specific nature of ambulatory medicine throughout the year;
- **In Phase 3**, the students are in their electives year and amplify their clinical skills with a stay of several weeks in a clinic in Switzerland or abroad.

Students must also write a thesis. This is a piece of independent, personal academic research, undertaken and documented by the student.

The study programme uses various formative assessment methods, such as MCQ tests, essays, OSCE, project work and direct observation. The information thus acquired is compiled in an electronic portfolio, which is a kind of diary that documents the student’s personal progress. The evaluation system includes self-reflection and the development of individual learning objectives by the students.

**Fribourg profile**

The Master's degree in Human Medicine at the University of Fribourg has the following particularities:

- Thanks to the strong focus on practical teaching and intensive exploration of concrete issues of medicine, the students receive broad medical training to Swiss national standards. At the same time, the emphasis at the University of Fribourg on general practice and people-oriented medicine, as well as the teaching concept that requires and promotes the active participation of students, is unique;
- Admission to the Master programme is restricted to 40 students. This small cohort offers a personal atmosphere and guarantees that students are well-accompanied during teaching units and their stays in the clinics;
- Human Medicine at the University of Fribourg is taught bilingually. The students have the opportunity of communicating with professionals, team colleagues and patients in German and in French. This offers them the chance to apply and expand their specialist terminology in both languages.

**Learning outcomes and career openings**

After successfully completing the course, students are admitted to the Swiss Federal Examination in Human Medicine. On passing this exam, candidates receive the Swiss medical diploma in medicine and can undertake the further training compulsory for independent medical practitioners. The main career options are:

- Independent medical practitioner: specialising in general medicine or another specialisation;
- Employed medical practitioner, usually in a hospital;
• Doctor in research (university, industry, etc.).
