Students first learn the necessary background in cryosphere and high-mountain geomorphological processes. Modules on theoretical and methodological approaches provide the foundations to independently assessing geoscientific and environmental issues. Amongst others, these modules include numerical modelling, GIS-based analysis, remote sensing, geophysical and geodetic measurement techniques, analysis of climatological time series and geomorphological field techniques.

Our specialised Master's degree aims at deepening knowledge and to perfect competences in the chosen cryospheric or geomorphological field. At the end of the programme, students will have demonstrated proficiency both in working in an interdisciplinary research team and in applying their knowledge independently during a research project of their own. The award of the degree requires creativity and reflexivity, as well as the ability to communicate ideas and work both in English and in the student's native language.

Integrative, interdisciplinary geography
The diverse research interests of around 30 researchers at the Unit of Geography make the specialised Master's course in Dynamics in Glaciology and Geomorphology truly integrative and interdisciplinary. Apart from the focus on topics in cryosphere, glaciology or alpine geomorphology, we also offer integrative training with the neighbouring disciplines of the Department, i.e. Human Geography, Earth Sciences and Environmental Sciences. During their Master's studies in Fribourg – and especially while working on their Master's thesis – students are part of research teams and can participate in on-going national and international research projects. The human dimensions of our diverse Department and the drive of the various research groups provide a supportive, quality environment for all students.

Structure of classes and lectures
All teaching is in English. The teaching is structured into four modules and is delivered through a combination of lectures, hands-on methodological courses, seminars, excursions and colloquia. A field trip is organised abroad in one of the teams' research regions every other year (Morocco in 2009, Namibia in 2011, Central Asia in 2013, Kyrgyzstan in 2017, Greenland in 2019), complemented by student-organised excursions in Switzerland.

1. The core module covers the conceptual and theoretical bases in geography. Students are taught the different approaches to human and physical geography at Master's level, as well as methods for collecting and analysing data. Three cycles of internal colloquia offer students a chance to gain more in-depth knowledge on current research topics.
2. The specialisation module equips the students with advanced knowledge in the chosen field.
3. A supporting module allows students to personalise their study programmes by pursuing courses related to their specialisation. Students can choose from a wide range of courses from the University of Fribourg, as well as other universities. Depending on the student’s prior education and training, the supporting module may also be used to fill in gaps.
4. The Master's thesis is carried out under the supervision of a professor and makes up a very substantial part of the
Career openings
This programme is intended for motivated students who are interested in pursuing a career in research – e.g. by pursuing a PhD – or in the public or private sector – e.g. in geoscientific/environmental consulting and protection, risk analysis and mitigation, documentation, public institutions or international organisations. The specialised Master's degree does not give access to the teacher education for academic upper secondary schools (DEEM or LDM) of the University of Fribourg.

Studies organisation

Structure of studies
120 ECTS credits, 4 semesters

Admission
Master's degree programmes are built on the knowledge and abilities that were acquired when obtaining a bachelor's degree.

Holders of a bachelor's degree awarded by a Swiss university are admitted to a master's degree programme without any preconditions if they have earned 60 or 90 ECTS credits – depending on the chosen master's degree programme – within the corresponding discipline. However, additional requirements can be required. The same applies to holders of a bachelor's degree awarded by a foreign university, provided that the bachelor's degree is recognised and considered equivalent by the University of Fribourg.

Holders of a bachelor's degree awarded by a Swiss or a foreign university, provided that the bachelor's degree is recognised and considered equivalent by the University of Fribourg, who do not fulfil this condition can be admitted to a master's degree programme with preconditions (which must be successfully completed before starting the master's degree programme) and/or additional requirements (which can be completed during the master's degree programme). The preconditions and/or additional requirements may not exceed 60 ECTS credits in total. The same applies to holders of a bachelor's degree awarded by a Swiss university of applied sciences, according to existing agreements.

The respective conditions of admission for each master's degree programme are reserved.
